► Problems we did not anticipate:

1. Android Studio- a heavy software made our pc slow and obstructed other process
2. A sudden problem with Windows and needed to install again that made us install the Android studio again.
3. Gradle is a build system(open source) which is used to automate building, testing, deployment etc. "build.gradle" are scripts where we can automate the tasks. On the second attempt of the project, we had issue such as gradle is not synchronized.
4. Update the gradle wrapper(is a script that invokes a declared version of Gradle)
5. Sdkversion update
6. Maven(is a project build management software,it means it lets you define your project, features and behaviours) repository required to be added again as suggested to migrate to AndroidX
7. Needed to add some other upgraded libraries
8. Failed to create fetch mysql database

SPECIAL THANKS TO OUR
COURSE TEACHER
